

The TESS 600 series is the perfect solution for applications where a compact, discrete shading system is required, and where light gaps at the edge of the fabric need to be eliminated. As with other TESS systems, it can deploy horizontally and vertically, bottom up or even side to side. It works equally well as an interior and exterior shade, and with our SideLock fabric retention system, it lends itself to both blackout and fly screen applications.

This compact design is achieved using a new concept for cable winding combined with a new patented tension mechanism.

Systems can be supplied from 30 inches wide to a maximum of 118 inches, and a maximum overall draw of 118 inches. A complete range of both screen and blackout fabrics are also available and all the external surfaces can be supplied in powder coat finish to any standard RAL colour.
